

Morphine

Uses: Morphine is prescribed in all cases when NSAID action is not sufficient and requires the use of strong opioid analgesics. It is widely used in **myocardial infarction to relieve pain** and for **calming the patient**. It is used in **pulmonary edema** and in few forms of **diarrhoea**.

It is used in surgery as a **preanesthetic medication** before the general anesthesia procedure begins.

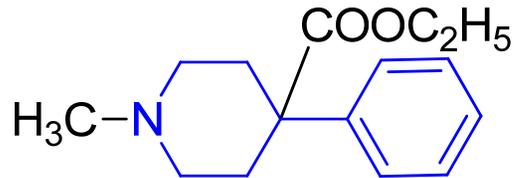

Codeine

MOA: Similar to morphine

Uses: This drug is very effective in oral use and is used for average to moderate pain. It is often used as an **antitussive drug**. Codeine is used to treat mild to **moderate pain** and also to **reduce coughing**.

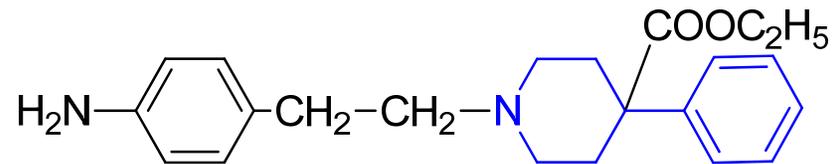

Meperidine

MOA: Similar to morphine

Uses: Meperidine is used to help **relieve moderate to severe pain**. Meperidine is widely used as **preanesthetic medication**. It is preferred in **obstetrical practice** due to its quick onset and short-lasting action.

Anileridine

MOA: Similar to morphine

Uses: Anileridine is a synthetic opioid and strong analgesic medication. It is a narcotic pain reliever used to **treat moderate to severe pain**.
